

Accent station with MTA system color.

Proposed improved bus interface with new seating and shelter

Overall site plan with improvements

## MTA Reisterstown Plaza Improvements Baltimore, MD

**Project:** Reisterstown Plaza is an intermodal bus/metro transit facility in Baltimore City. The transit station area has a large park and ride lot with surplus land under MTA control. The task was to develop general enhancement strategies, which would make the station architecturally more pleasing and more user friendly. The task was the follow up to a "Visual Preference Study" which MTA had conducted for this area and occurred in conjunction with the completion of new mixed use components for transit riders such as a new daycare center on the site. ArchPlan developed a menu of design improvements and station enhancements from which MTA will select and develop a construction budget. Proposed changes involve the bus interface, pedestrian and vehicular circulation, signs, station identity (color) and additional amenities such as shelters and canopies.

ArchPlan worked on this project as a subconsultant to De Leuw Cather & Associates.
